

Hiregram.ai Integration Blueprint

Based on our architectural review, Hiregram.ai is a consumer application without a public developer API. Below are three potential blueprints for integrating its functionality into the Zythron Hackathon project.

Strategy 1: The "Iframe / Web-Embed" Route (Fastest)

Overview:

If you want users to access Hiregram's AI interviewer without leaving your app, embed their site inside your Next.js frontend.

Blueprint steps:

1. Create a new route in your Next.js app (e.g., frontend/src/app/mock-interview/page.tsx).
2. Add an HTML `<iframe>` pointing to <https://hiregram.ai/sign-in>.

Pros: Takes 2 minutes to build.

Cons: Hiregram might block iframe embedding (via X-Frame-Options headers), and user data/auth won't sync with your backend.

Strategy 2: Deep-Linking (The Handoff)

Overview:

Treat Hiregram as a third-party partner platform rather than natively embedding it.

Blueprint steps:

1. In your Chat UI, prompt the Gemini AI to detect when a user wants to practice for an interview.
2. When detected, have Gemini return a structured JSON response or a special UI card.
3. Your frontend renders a 'Start Mock Interview' button that opens <https://hiregram.ai> in a new tab.

Pros: 100% reliable, zero API dependencies.

Cons: Breaks the native user experience.

Strategy 3: The "Build Your Own Sara" Route (Highly Recommended)

Overview:

Hiregram.ai Integration Blueprint

Since you've already built a Voice-to-Text frontend and a Gemini+Pinecone backend, you already have 90% of the underlying technology that Hiregram uses! You can replicate the exact feature natively.

Blueprint steps:

1. System Prompt Update: Add an endpoint (/api/mock-interview) where Gemini is given a strict system prompt: 'You are an expert interviewer. Ask one technical question at a time, wait for the user's answer, and then ask a follow-up or provide feedback.'
2. Context Injection: When the user selects a role, query your Pinecone database for the required skills and feed that into Gemini's prompt.
3. Voice UI: Reuse the window.speechSynthesis and SpeechRecognition logic we already built in page.tsx.
4. Feedback Report: When the user says 'end interview', have Gemini generate a Markdown report scoring their communication and technical skills.

Pros: You control the data, it's deeply integrated with your Pinecone job database, and it looks incredibly impressive to hackathon judges.
